**DON'T
PANIC**

Filtering: The math behind the match

1. Line up the feature and the image patch.
2. Multiply each image pixel by the corresponding feature pixel.
3. Add them up.
4. Divide by the total number of pixels in the feature.

Pooling: Shrinking the image stack

1. Pick a window size (usually 2 or 3).
2. Pick a stride (usually 2).
3. Walk your window across your filtered images.
4. From each window, take the maximum value.

Gradient descent

For each feature pixel and voting weight, adjust it up and down a bit and see how the error changes.

Not just images

Any 2D (or 3D) data.

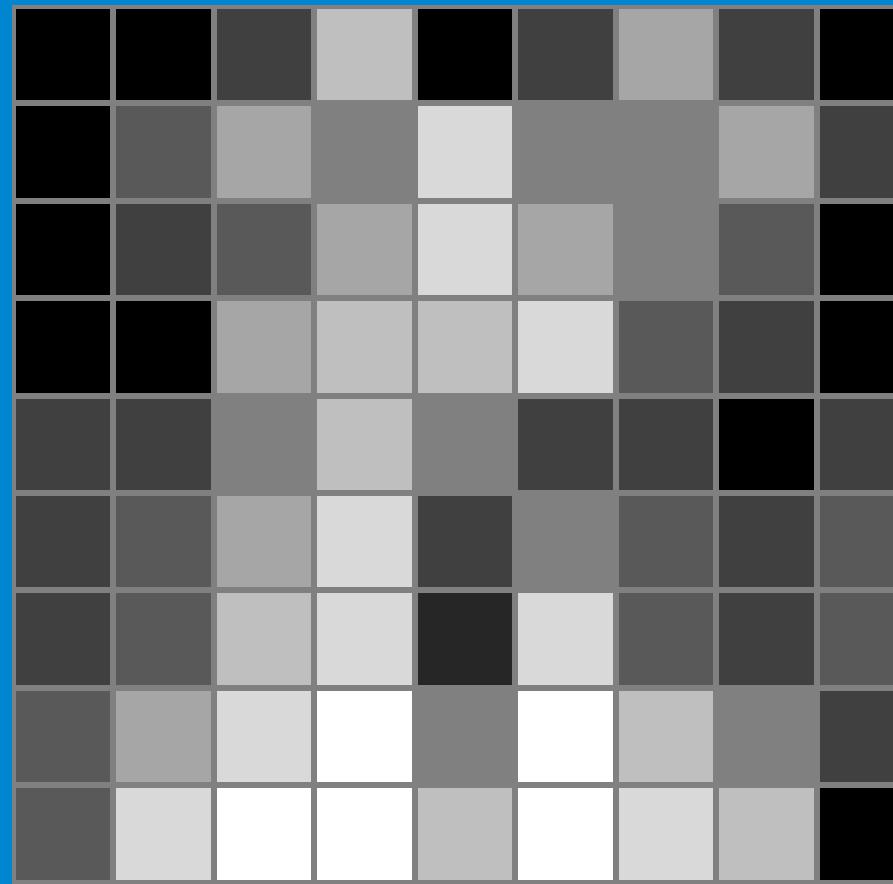

Things closer together are more closely related
than things far away.

Limitations

ConvNets only capture local “spatial” patterns in data.

If the data can’t be made to look like an image, ConvNets are less useful.

Rule of thumb

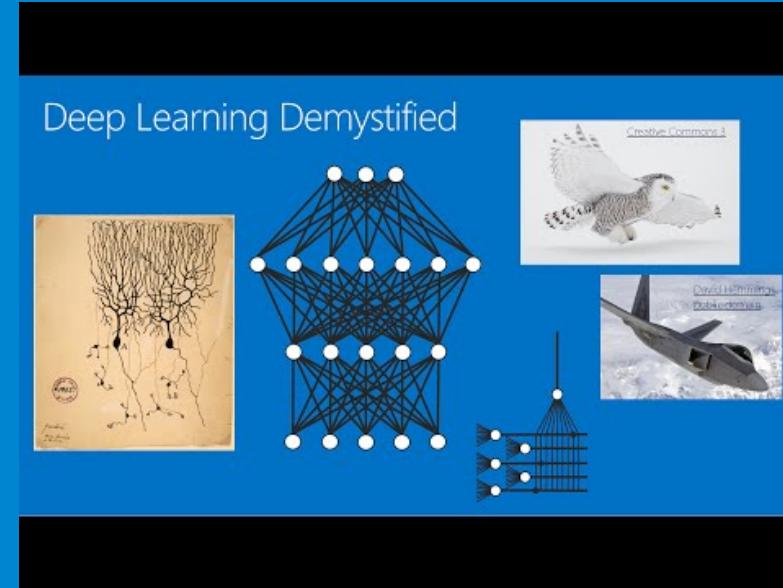

If your data is just as useful after swapping any of your columns with each other, then you can't use Convolutional Neural Networks.

In a nutshell

ConvNets are great at finding patterns and using them to classify images.
